

CryptoPulse AI

An AI-native crypto intelligence platform combining next-candle prediction, live nowcast, technical analysis, and market-moving news in one trading workflow.

Presented by

Jolanda Tinge

The Problem: Disconnected Signal Stacks

Crypto traders make short-horizon decisions across fragmented tools — exactly when speed matters most.

Too Many Surfaces

Charts, indicators, and crypto-native news sit in separate products, creating friction at critical moments.

No "What Next?" Layer

Most tools visualize the market but don't synthesize trader-facing expectations for the next candle.

News Impact Under-Modeled

Crypto volatility is highly sensitive to headlines, yet catalysts are rarely integrated into execution workflows.

The Solution: One Crypto-Native Operating Layer

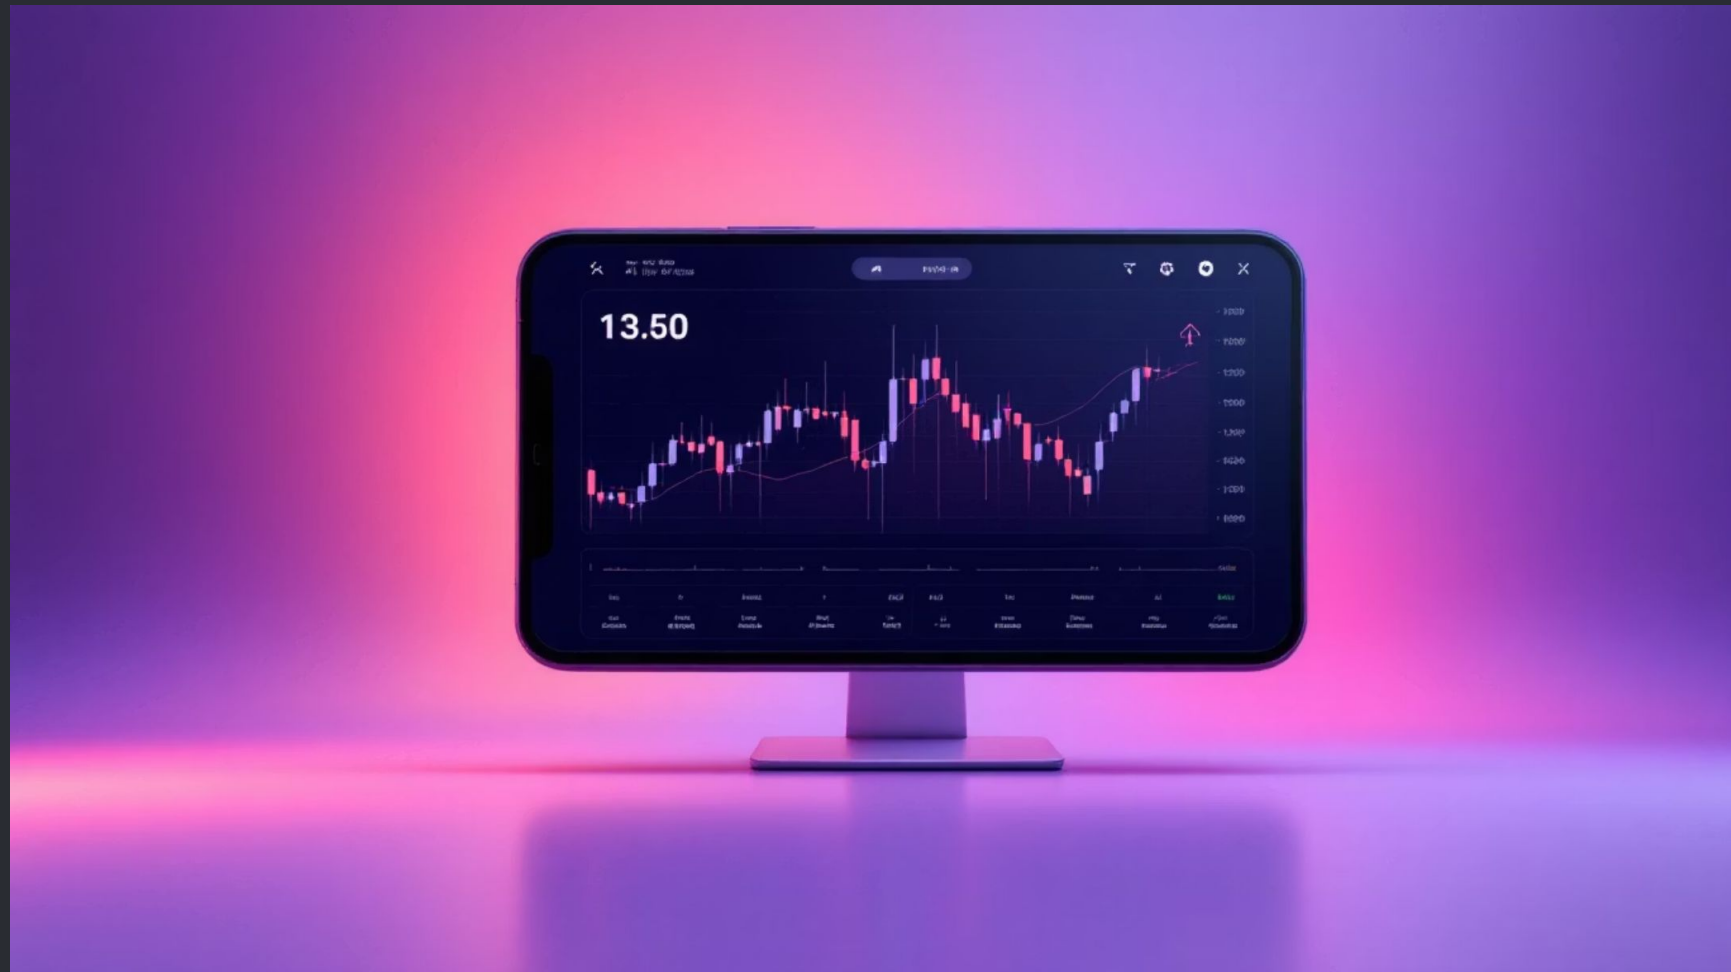

Core Value Proposition

- Next-candle BTC prediction across key horizons
- Live nowcasts while the current bar is forming
- Technical analysis and structure-driven context
- Integrated crypto, finance, and geopolitical news

📄 **MVP Prediction Pairs:** 15m/15m, 15m/1h, 1h/1h, 1h/4h, 4h/4h, 4h/1d — tuned for short-term crypto workflows.

Product: Prediction + Chart + Context

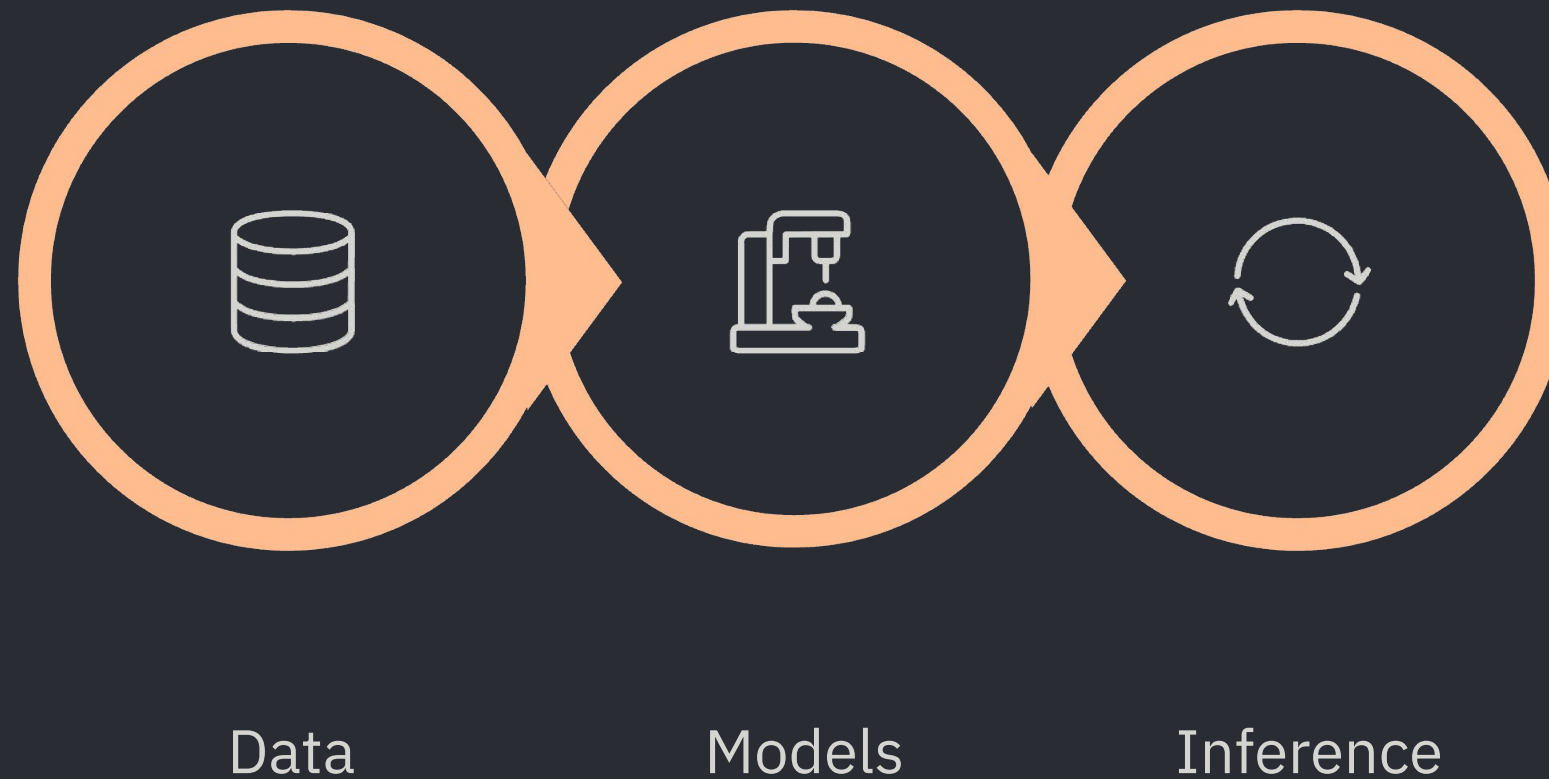

Official vs Live

Closed-bar predictions are clearly separated from 15-minute live nowcasts. The forecast is intentionally simplified to reduce noise and improve readability.

History + TA + News

Historical performance, technical analysis, and latest hot news sit next to the live signal layer — all in one interface.

Under the Hood: Data → Features → Models → Interface

The scheduler keeps raw data, live features, and predictions updated — making the product feel live, not batch-driven.

The Context Layer: Designed for Crypto

Not copied from generic business dashboards — built specifically for crypto-native signal workflows.

Crypto

RSS-driven feeds avoid API-key dependence and capture crypto-native publishers faster.

Finance

Rates, macro, and market stress matter — crypto reacts to broader liquidity conditions.

Geopolitics

War, sanctions, elections, and policy shocks trigger fast risk-on/risk-off shifts in crypto.

The Engine Is Already Running

5min

Refresh Cadence

Predictions and nowcasts updated every
five minutes

6

Prediction Configs

Core timeframe/horizon combinations
live in MVP

4

Product Surfaces

Signal, history, TA, and curated news in
one interface

❏ **This is not a generic SaaS dashboard.** It is infrastructure for crypto-native decision velocity — BTC short-horizon prediction is a focused wedge with clear trader pain and room to expand into multi-asset coverage.

Business Model: SaaS → Signal Infrastructure

Advanced Retail

Subscription — Premium access to timeframes, analytics depth, alerts, and richer signal visibility.

Trading Teams

Desk Tooling — Shared dashboards, team seats, and workflow features for small funds and prop-style teams.

Infra Monetization

API Signals — Prediction feeds for quant workflows, external tools, and strategy builders.

Distribution starts with advanced retail traders, then extends to small funds, signal communities, and API consumers. As usage grows, model refinement and workflow design compound into a stronger product moat.

Roadmap: MVP → Closed Beta → Signal Platform

Thank You!

Raising €500K Pre-Seed

Use of Funds

- Product hardening and closed-beta readiness
- Additional backend / ML engineering capacity
- Data reliability, infrastructure, and monitoring
- Early distribution into crypto trader communities

Intended Milestone

Bridge technical credibility into user validation, repeat usage, and first monetization signals.
